Project description

The Blank Operating System Layer (OSL) is an interface that enables intuitive OS control using natural language. It combines a large language model, a client, and specialized servers that communicate via the Model Context Protocol (MCP). Servers manage file operations, process control, and miscellaneous services. The client translates user requests into validated commands, seeks clarification when needed, and requires user approval before execution. Third-party applications can also interact with the system through the client's interface.
